ABSTRACT

Mental health has emerged as a critical concern in today's fast-paced and demanding world, where stress, anxiety, emotional instability, and low self-confidence affect people across all age groups. Despite growing awareness around psychological well-being, many individuals still hesitate to seek professional help due to social stigma, limited accessibility, lack of guidance, or the unavailability of reliable support systems.

To address these challenges, **MConnect** has been designed as a scalable digital platform that connects individuals in need of emotional support with qualified professional therapists through a secure and accessible environment. The platform serves as a bridge between users seeking guidance and trained therapists who help them develop emotional resilience, self-awareness, and psychological strength.

A key feature of MConnect is its structured mental health assessment system, which evaluates users on parameters such as stress, anxiety, and self-confidence. Based on these assessments, users receive scores that reflect their emotional condition. These results are further used to generate a **Personal Growth Graph**, enabling users to monitor their progress over time. This visual tracking mechanism encourages continuous self-improvement while also providing measurable indicators of emotional development.

The platform also incorporates an intelligent therapist recommendation system. Based on assessment outcomes, users are categorized into severity levels such as mild, moderate, and severe. Therapists are then recommended according to their expertise, specialization, and experience, ensuring more accurate therapist-user matching and improving the effectiveness of support provided.

In addition, MConnect focuses strongly on accessibility and inclusivity by offering bilingual support in English and Hindi, maintaining user confidentiality, and introducing age-based subscription plans to suit different user groups. By combining technology with structured mental health support, MConnect aims to deliver a practical, scalable, and socially impactful solution that promotes emotional well-being and long-term mental wellness.

1.1 Problem Background

Mental health challenges such as stress, anxiety, emotional instability, and low self-awareness are increasing rapidly across all age groups, particularly among children, teenagers, and young adults. Many individuals continue to struggle silently due to lack of proper guidance, social stigma surrounding therapy, and limited access to qualified mental health professionals. Although several digital platforms offer counseling services, many existing solutions lack structured mechanisms for monitoring personal growth and do not provide intelligent therapist recommendations based on an individual's emotional condition.

There is a growing need for a secure, accessible, and scalable system where individuals, including children and parents, can independently seek professional support, assess their mental well-being, and monitor their progress over time. Such a platform should not only connect users with suitable therapists but also provide personalized therapy support through features like emotional assessments, progress tracking, and therapist matching based on severity and specialization. Addressing these gaps can lead to more effective support, improved therapy outcomes, and greater awareness of long-term mental wellness.

1.2 Objective of the Project

The primary objective of **MConnect** is to develop a bilingual (English and Hindi) digital platform that provides a secure and accessible space for individuals, children, and parents to connect with professional therapists. The platform aims to make mental health support more approachable and organized through the integration of technology-driven solutions.

One of the key objectives is to provide structured mental health assessments that evaluate a user's emotional well-being and generate measurable results related to conditions such as stress, anxiety, and self-confidence. Based on these assessment outcomes, the system is designed to track emotional development through a **Personal Growth Graph**, enabling users to monitor their improvement over time and encouraging continuous self-growth.

Another important objective is to implement an intelligent therapist recommendation system that suggests therapists based on the severity level identified in the assessment, ensuring more accurate matching and effective professional guidance. The platform also aims to deliver affordable subscription-based mental wellness services tailored to different age groups, while maintaining complete confidentiality, independent access, and inclusive support for all users. Through these objectives, MConnect seeks to promote emotional well-being, accessibility, and long-term mental wellness.

1.3 Proposed Solution / System Overview

MConnect is a scalable, subscription-based mental health support platform designed for therapists, children, parents, and individuals, where parent and child accounts operate independently to ensure personalized access and privacy. The platform provides a structured digital environment where users can register, access mental health support services, and receive professional guidance according to their emotional needs.

The scope of the system includes structured mental health assessments through which users are evaluated and categorized into severity levels based on their emotional condition. Based on these

results, the platform generates a **Personal Growth Graph** that allows users to track emotional improvement over time, promoting self-awareness and continuous development.

The system also includes an intelligent therapist recommendation mechanism that filters and suggests therapists according to assessment severity and specialization, enabling more accurate therapist-user matching and improving therapy effectiveness. To support ongoing interaction and guidance, the platform provides secure chat and video counseling sessions between users and therapists.

Additionally, MConnect covers multiple functional modules such as user management, assessment and scoring, growth analytics, therapist filtering, subscription management, communication tools, and a wellness resource library. These components collectively ensure scalability, accessibility, and effective therapy outcomes while creating a comprehensive and user-centered mental wellness solution.

1.4 Key Features or Functionality

Independent User Access
MConnect provides separate and independent access for children, parents, and individual users, ensuring privacy and personalized support for each user category.

Structured Mental Health Assessments
The platform includes scientifically designed assessments to evaluate emotional conditions such as stress, anxiety, and self-confidence, generating structured scores for analysis.

Personal Growth Graph
Based on assessment results, users can view a Personal Growth Graph that tracks emotional progress over time, helping monitor improvement and encouraging self-development.

Intelligent Therapist Filtering
Therapists are recommended based on assessment scores, severity levels, and specialization, enabling accurate therapist-user matching and improving therapy outcomes.

Secure Communication Support
The platform supports secure chat and video counseling sessions, allowing users to communicate with therapists in a confidential and supportive environment.

Age-Based Subscription Plans
MConnect offers affordable subscription plans tailored to different age groups, making mental wellness services accessible to a broader range of users.

Bilingual Support
The platform provides support in both English and Hindi, improving accessibility and usability for diverse users.

Confidentiality and Privacy
Strong confidentiality measures are integrated into the system to protect user data, ensure secure interactions, and build trust in the platform.

.

1.5 Technology / Method Used

The MConnect platform is developed using modern web technologies to ensure scalability, security, and efficient performance. The frontend is built using **React.js**, which provides a dynamic and responsive user interface for seamless interaction across different user roles. For backend development, **Node.js** and **Express.js** are used to manage server-side logic, API handling, and communication between the client and database.

MongoDB is used as the database for storing user profiles, assessment records, therapist data, subscriptions, and communication-related information in a flexible and scalable manner. To ensure security and controlled access, the system implements **JWT (JSON Web Token) authentication**, enabling secure login and role-based access for users, parents, children, and therapists.

The platform also includes a **score-based mental health assessment engine** that evaluates users and categorizes them according to severity levels. Based on these results, a **severity-based therapist recommendation system** is implemented to provide accurate therapist matching according to specialization and emotional condition.

For continuous counseling support, **secure chat and video communication APIs** are integrated, allowing confidential interaction between users and therapists. The overall system follows a scalable architecture, making it suitable for handling growing user demands while also supporting future enhancements such as advanced analytics, machine learning models, or AI-driven mental health features.

MConnect aims to make therapy accessible, affordable, and structured. The Personal Growth Graph helps users visually monitor improvement, while intelligent therapist matching enhances counseling effectiveness. The platform promotes mental health awareness and supports scalable growth of users and therapists.

1.6 Original Contribution Statement

MConnect presents an original and scalable approach to digital mental wellness by integrating multiple features that go beyond conventional counseling platforms. The novelty of the system lies in providing **independent user access** for children, parents, and individuals, ensuring personalized support while maintaining privacy and flexibility for different user groups.

A key innovative aspect of the platform is its **structured mental health assessment and scoring system**, which evaluates emotional conditions and categorizes users based on severity levels. Unlike traditional platforms, MConnect further uses these results to generate a **Personal Growth Graph**, allowing users to track emotional progress over time and making mental wellness measurable and goal-oriented.

Another unique contribution is the **intelligent therapist filtering mechanism**, where therapists are recommended according to emotional severity levels and specialization, improving the accuracy and effectiveness of therapist-user matching. The inclusion of **bilingual support (English and Hindi)** enhances accessibility, while **age-based subscription plans** make mental wellness services more affordable and adaptable for diverse users.

By combining assessment-driven support, growth tracking, personalized therapist recommendations, and scalable digital accessibility, MConnect offers a distinctive and socially impactful solution in the mental health domain.
